The Microcosm of Works of Art is a vista to be opened to conservators, art scientists, art historians and the public in museums. We have mounted a high resolution microscopy system (HIROX) on a specially designed X-Y-Z stand system (MOPAS) that enables direct microscopy of works of art both horizontally as well as vertically.

This poster shows various examination modes with the instrumental setup and lighting conditions in case studies.

The portable T-stand for horizontal and vertical work is light weight and fits in a suitcase suitable for air transport (weight under 23 kg). It is demonstrated at the Hirox USA stand 551 in the Exhibition Hall.

Heavier constructions were developed as permanent setup in the conservation studio. In horizontal mode the art work and the microscope-stand system are one unit thus minimizing environmental vibrational noise. Special tables have been designed for mobility within a museum or conservation studio. See also jaap-enterprise.com.

High resolution high magnification viewing with the HIROX on MOPAS supports recording as calibrated still images, tiled images or videos. Videos while micro-moving the microscope over the surface, are particularly useful for examination of painting surfaces in poor condition by conservators.

Imaging with the HIROX Z-direction submicron stepper makes it possible to obtain 3D in-focus images and digital 3D image data sets that can be processed for 2D- and 3D-profile measurements and depth profiling. See also www.hirox.com

Acknowledgement: We thank Frans Hals Museum Haarlem (NL), Redivivus Conservation Studio The Hague (NL), Henie-Onstad Kunstsenter (Oslo (N)), the Jan van Eyck Research team of KIK-IRPA in Ghent (B) and Rijksmuseum Amsterdam (NL) for permission to use our own or their pictures.
Lighting conditions are vitally important in painting studies

Investigation of *Woman with Kimono* by Breitner at Redivivus Studio (The Hague)

- Bright field: specular reflection but good information on varnish surface condition.
- Dark field: more diffusing light condition images the paints

Horizontal Bridge stand

Bright field

Dark field

Brush work by Frans Hals of a Regent’s cuff using the tiling option in the KH7700. Live tiling by moving the microscope camera over the horizontal high precision bar of stand

Studies of the condition of Karel Appel 1950/60’s paintings at the Henie-Onstad Kunstcenter in Norway illustrating fabulous brush work but also severe damage due to internal chemical reactivity causing exudation, dripping, premature cracks and delamination.

- Rotary Head attachment on a MX2016-Z lens looks sideways rotating over 360 degrees
